报告摘要: In [1], Fock and Goncharov introduced a pair of moduli spaces (X, A) dual to each other which generalized the enhanced Teichmuller space and the decorated Teichmuller space. In the first lecture, we will introduce some basic tools like their parameterization, monodromy computation, cluster ensemble structure, induced Poisson structure, Goncharov–Shen potential [2] and some related topics. In the second lecture, we will introduce their duality conjecture.
